## Drain Fly Abatement Program

Due to customer demand, we are now offering a service to reduce and/or possibly eliminate current infestations of vinegar flies (small fruit flies), phorid flies, and drain flies. These pests, most often associate with drains, require a moist-organic material for egg laying and larval feeding. Removal of this material is essential for their control.

This program is for the treatment of floor drains and drain lines (which are major breeding sources). However, total elimination requires a coordinate effort to remove other breeding sources. A Facility Inspection Report will be issued to help pin-point areas where your help will be needed to correct housekeeping deficiencies. The principal treatment steps of this four (4) week program are as follows:

- Steam clean floor drains and drain lines. Clean and sanitize drains through direct and controlled high temperature steam vapor. Dissolves impurities, removes bacteria and eliminates harborage sites.
- Application of a bacterial drain treatment to floor drains and drain lines. Highly concentrated gel clings to the sides of drains and pipes, removing organic material flies breed in. Safe for all types of plumbing.
- Spot treatment of active area (s) with a non-residual aerosol Insecticide. Used to reduce adult population to speed control.
- Facility Inspection report.
